PROJECT OVERVIEW

# Supply Chain Analysis

## Project Description

This project aims to analyze supply chain data and gain a clearer understanding of how products move from suppliers to customers. It will examine key areas such as supplier performance, order processing, inventory levels, shipping costs, and delivery times.

The analysis will use relevant performance indicators to identify trends, recurring delays, and possible inefficiencies across the supply chain.

The project will also explore how factors such as product demand, stock availability, and delivery performance may affect overall operations. Findings will be presented through clear visualizations and a dashboard, making the results easier to understand.

The final insights can help highlight opportunities to improve inventory planning, manage supplier relationships, reduce delays, and support more informed, data-driven decisions.
